## Code Changes

### Changes Made:

- TextInput for user to input question, question key
- NumberInput for user to input question mark
- Navigation icon for last, next question
- Delete question button
- New question button

## Review Comments

### General Comments

- Create a new folder to store images

### Specific Comments

File	Line Number	Comment	Following Action
<a href="#">src/tt-frontend/src/components/test-developer/QuestionListtsx</a>		could you please use in wrapper folder to wrap the QuestionList? just like what we did for the test list.  Currently, there would be page overflowing if I created many questions	Added <ScrollableWrapper> to wrap questions in a list
<a href="#">src/tt-frontend/src/components/test-developer/</a>	147-197	this jsx code is too long and hard to read, consider to refactor it and make it more readable.	Refactor the code outside of return section, and name them using understandable variables

<a href="#">Content/QuestionContent.tsx</a>		see the sample react component file in project readme file	
<a href="#">src/tt-frontend/src/components/test-developer/TestContent/QuestionContent.tsx</a>	83-144	don't nest a react component definition inside another one, this will lead to unexpected bugs. Move EditableTextField component to a standalone file.	Extract the component into a new file, as EditableTextfield.tsx
<a href="#">src/tt-frontend/src/components/test-developer/TestContent/QuestionList.tsx</a>	70-76	better use prevState as this state update is dependent on previous state	Change to use prevState
<a href="#">src/tt-frontend/src/components/test-developer/TestContent/QuestionContent.tsx</a>	43-46	give a better name to this function	Change function handleArrowIcon to handleNavigateQuestion

## Conclusions
