Code Changes

Changes Made:

- Add select drop down box for marker
- Integrate with fetch marker list API
- Integrate with assign marker API
- Enable function for "Assign Marker" button

General Comments

Assign mark works fine.

Can you update to make marker directly visible if a test already had a marker assigned? When I open a auto-mark modal of a test and that test already has a marker, the assign marker dropdown select should be populated with a value.

Specific Comments

File	Line Number	Comment	Following Action
src/tt-frontend/src/components/test-developer/modals/AutoMarkModal.tsx	null	Because the markedBy value is from testList, I believe the testList will only be updated after you click "Save test"? unless there is an individual API call for retrieving marker value. It should be fine with existing API. You have saved the new marker information in TestList (markedBy field), just need to convert that markedBy to a user name	I have edited to update the testList, although I don't think it's appropriate to do so. Considering the backend already has the new value, it seems weird to update it again in the front end.
	233 - 240	It would be better if updating testlist after assignMarker request succeed to keep consistency.	Move update testList inside of try catch
