Code Changes

Changes Made:

- added modal for user to config rating scale of a selected questions
- fixed inconsistency issue: when user save a test, the selected question id is automatically reset to the first question in the test. I changed this to: remain the same selected question id when save a test.

General Comments

- found a bit inconsistent interaction logic: when user hit confirm button in rating scale setup modal, it will trigger auto saving of the test.

Specific Comments

File	Line Number	Comment	Following Action
`src/tt-frontend/src/components/test-developer/modals/SetRateScaleModal.tsx`	null	found a bit wired interaction logic: • Logic is a bit weird, when I click confirm, I've actually saved this to the back-end, despite I did not click "save test". This will lead to the situation, a new test, despite I did not save it, it will be automatically saved?	proceed to remove auto-save function when user hit the confirm button in the ratingScale setup modal

✏️ Conclusions

🎋 good feedback for user experience from peer review
